**Derivatives of heterocycles with 5 members, their preparation and  
their use as medicaments**

--This application is a 371 of PCT/FR00/02805 filed October 10, 2000.--

The present invention relates to the use of compounds of general formula (I) for preparing a medicament intended to inhibit monoamine oxydases (MAO) and/or lipidic peroxidation and/or to act as modulators of the sodium channels. A subject of the invention is also, as medicaments, the compounds of general formula (II) defined  
5 hereafter. Moreover it relates to new compounds of general formula (III).

The compounds mentioned above often present 2 or 3 of the activities mentioned above, which confer advantageous pharmacological properties on them.

In fact, taking into account the potentiel role of the MAO's and ROS's ("*reactive oxygen species*", at the origin of lipidic peroxidation) in physiopathology, the new described  
10 derivatives corresponding to general formula (I) can produce beneficial or favorable effects in the treatment of pathologies where these enzymes and/or these radical species are involved. In particular:

- disorders of the central or peripheral nervous system such as for example neurological diseases where Parkinson's disease, cerebral or spinal cord  
15 traumatisms, cerebral infarction, sub arachnoid hemorrhage, epilepsy, ageing, senile dementia, Alzheimer's disease, Huntington's chorea, amyotrophic lateral sclerosis, peripheral neuropathies, pain can in particular be mentioned;
- schizophrenia, depressions, psychoses;
- disorders of the memory and the humour;
- 20 • pathologies such as for example migraine;
- behavioural disorders, bulimia and anorexia;
- auto-immune and viral diseases such as for example lupus, AIDS, parasitic and viral infections, diabetes and its complications, multiple sclerosis.
- addiction to toxic substances;

21. Pharmaceutical composition containing as active ingredient at least one compound of general formula (II) as defined in claim 16 or of general formula (III) as defined in claim 19, or a pharmaceutically acceptable salt of said compound.

**Derivatives of heterocycles with 5 members, their preparation and  
their use as medicaments**

The present invention relates to the use of compounds of general formula (I) for preparing a medicament intended to inhibit monoamine oxydases (MAO) and/or lipidic peroxidation and/or to act as modulators of the sodium channels. A subject of the invention is also, as medicaments, the compounds of general formula (II) defined  
5 hereafter. Moreover it relates to new compounds of general formula (III).

The compounds mentioned above often present 2 or 3 of the activities mentioned above, which confer advantageous pharmacological properties on them.

In fact, taking into account the potentiel role of the MAO's and ROS's ("*reactive oxygen species*", at the origin of lipidic peroxidation) in physiopathology, the new described  
10 derivatives corresponding to general formula (I) can produce beneficial or favorable effects in the treatment of pathologies where these enzymes and/or these radical species are involved. In particular:

- disorders of the central or peripheral nervous system such as for example neurological diseases where Parkinson's disease, cerebral or spinal cord  
15 traumatism, cerebral infarction, sub arachnoid hemorrhage, epilepsy, ageing, senile dementia, Alzheimer's disease, Huntington's chorea, amyotrophic lateral sclerosis, peripheral neuropathies, pain can in particular be mentioned;
- schizophrenia, depressions, psychoses;
- disorders of the memory and the humour;
- 20 • pathologies such as for example migraine;
- behavioural disorders, bulimia and anorexia;
- auto-immune and viral diseases such as for example lupus, AIDS, parasitic and viral infections, diabetes and its complications, multiple sclerosis.
- addiction to toxic substances;

- proliferative and inflammatory pathologies;
- and more generally all the pathologies characterised by an excessive production of ROS's and/or participation of MAO's.

In all of these pathologies, experimental evidence exists which demonstrates the involvement of ROS's (*Free Radic. Biol. Med.* (1996) **20**, 675-705; *Antioxid. Health. Dis.* (1997) **4** (Handbook of Synthetic Antioxidants), 1-52) as well as the involvement of MAO's (Goodman & Gilman's: *The pharmacological basis of therapeutics* , 9th ed., 1995, 431-519).

The advantage of a combination of the inhibitory activities of MAO and inhibition of lipidic peroxidation is for example well illustrated in Parkinson's disease. This pathology is characterized by a loss of dopaminergic neurons of the nigrostriatal route the cause of which would in part be linked to an oxidizing stress due to ROS's. The exogenic dopamine from L Dopa is used in therapeutics in order to maintain sufficient levels of dopamine. MAO inhibitors are also used with L Dopa to avoid its metabolic degradation but do not act on the ROS's. Compounds which act both on MAO's and ROS's will therefore have a certain advantage.

Moreover, the character of the modulator of the sodium channels is very useful for therapeutic indications such as:

- the treatment or prevention of pain, and in particular:
  - ❖ post-operative pain,
  - ❖ migraine,
  - ❖ neuropathic pain such as trigeminal neuralgia, post-herpetic pain, diabetic neuropathies, glossopharyngeal neuralgias, secondary radiculopathies and neuropathies associated with metastatic infiltrations, adiposis dolorosa and pain associated with burns,
  - ❖ central pain as a result of vascular cerebral accidents, thalamic lesions and multiple sclerosis, and
  - ❖ chronic inflammatory pain or pain linked to a cancer;
- the treatment of epilepsy;
- the treatment of disorders linked to neurodegeneration, and in particular:
  - ❖ vascular cerebral accidents,
  - ❖ cerebral traumatism, and
  - ❖ neurodegenerative diseases such as Alzheimer's disease, Parkinson's disease and amyotrophic lateral sclerosis;

- the treatment of bipolar disorders and irritable colon syndrome.

The concrete advantages of the presence in a compound of at least one of these activities is therefore clearly apparent from the above.

5 The European Patent Application EP 432 740 describes derivatives of hydroxyphenylthiazoles, which can be used in the treatment of inflammatory diseases, in particular rheumatic diseases. These derivatives of hydroxyphenylthiazoles show properties of trapping free radicals and inhibitors of the metabolism of arachidonic acid (they inhibit lipooxygenase and cyclooxygenase).

10 Other derivatives of hydroxyphenylthiazoles or hydroxyphenyloxazoles are described in the PCT Patent Application WO 99/09829. These have analgesic properties.

A certain number of derivatives of imidazoles with close or identical structures to those of the compounds corresponding to general formula (I) according to the invention have moreover been described by the Applicant in the PCT Patent Application WO 99/64401 as agonists or antagonists of somatostatin. However, said derivatives of imidazoles  
15 have therapeutic properties in fields different from those indicated above (suppression of the growth hormone and the treatment of acromegalia, treatment of the recurrence of stenosis, inhibition of the secretion of gastric acid and prevention of gastro-intestinal bleeding in particular).

Moreover, the compounds of general formula (A1)

25 are inhibitors of the NO synthases and can be used to treat diseases which include in particular cardiovascular or cerebral ischemia, cerebral hemorrhage, disorders of the central nervous system, Alzheimer's disease, multiple sclerosis, diabetes, hepatitis, migraine, rheumatoid arthritis and osteoporosis.

In a different field, the Applicant has itself previously described in the PCT Patent Application WO 98/58934 derivatives of amidines having the ability to inhibit NO synthases and/or lipidic peroxidation.

5 The Applicant has now unexpectedly discovered that certain intermediates of the first stages of synthesis of the amidines described in the PCT Patent Application WO 98/58934, and more generally certain derivatives of heterocycles with five members, namely the products of general formula (I) defined hereafter, have at least one of the three properties chosen from the following properties (and often even two of these three properties even sometimes all three at the same time):

- 10 - MAO inhibition properties;  
 - lipidic peroxidation inhibition properties; and  
 - properties of modulating the sodium channels.

15 These advantageous properties offer the advantage of opening up numerous uses for such compounds, in particular in the treatment of neurodegenerative diseases, and in particular those indicated previously, of pain or of epilepsy.

or pharmaceutically acceptable salts of the compounds of general formula (I);

20 can be used for preparing a medicament intended to have at least one of the following three activities:

- to inhibit the monoamine oxydases, in particular monoamine oxydase B,
- to inhibit lipidic peroxidation,
- to have a modulating activity vis-à-vis the sodium channels.

25 According to preferred variants of the invention, these compounds have at least two of the activities mentioned above. In particular, they inhibit both the MAO's and trap the ROS's or they will have both an antagonist activity vis-à-vis the sodium channels and a trapping activity on the ROS's. In certain cases, the compounds of general formula (I) even combine the three activities.

This allows the compounds of general formula (I) to be of use in the treatment of the diseases mentioned previously such as being linked to MAO's, to lipidic peroxidation and to the sodium channels.

25 According to a more particular variant of the invention, the compounds of the invention of general formula (I) as defined previously in which:

Het is such that the compounds of general formula (I) correspond to one of the general sub-formulae (I)<sub>1</sub> and (I)<sub>2</sub> in which X represents NH or S or general sub-formula (I)<sub>3</sub> in which Y represents O;

A represents a

radical in which Q represents OH, two of the R<sup>19</sup>, R<sup>20</sup> and R<sup>21</sup> radicals represent an alkyl radical and the third represents a hydrogen atom,

or in which Q represents a phenyl radical substituted by an OH radical and one or more radicals chosen independently from alkyl radicals;

The same preferences as those indicated for the compounds of general formula (I) and (II) are moreover applicable by analogy to the compounds of general formula (III).

In certain cases, the compounds according to the present invention (i.e. the compounds of general formula (I), (II) or (III)) can contain asymmetrical carbon atoms. As a result, the compounds according to the present invention have two possible enantiomeric forms, i.e. the "R" and "S" configurations. The present invention includes  
5 the two enantiomeric forms and all combinations of these forms, including the racemic "RS" mixtures. For the sake of simplicity, when no specific configuration is indicated in the structural formulae, it should be understood that the two enantiomeric forms and their mixtures are represented.

The invention also relates to of the pharmaceutical compositions containing, as active  
10 ingredient, a compound of general formula (II) or a pharmaceutically acceptable salt of a compound general formula (II), as well as the use of the compounds of general formula (II) for preparing a medicament intended to inhibit the monoamine oxydases, in particular monoamine oxydase B, to inhibit lipidic peroxidation, to have a modulatory activity on the sodium channels or to have two of the three or all three  
15 aforementioned activities.

The invention relates moreover, as medicaments, to the compounds of general formula (III) or their pharmaceutically acceptable salts. Similarly it relates to the pharmaceutical compositions containing, as active ingredient, a compound of general formula (III) or a pharmaceutically acceptable salt of a compound of general formula  
20 (III), as well as to the use of the compounds of general formula (III) for preparing a medicament intended to inhibit monoamine oxydases, in particular monoamine oxydase B, to inhibit lipidic peroxidation, to have a modulatory activity on the sodium channels or to have two of the three or all three of the aforementioned activities.

In particular, the compounds of general formula (I), (II) or (III) can be used for  
25 preparing a medicament intended to treat one of the following disorders or one of the following diseases: Parkinson's disease, senile dementia, Alzheimer's disease, Huntington's chorea, amyotrophic lateral sclerosis, schizophrenia, depressions, psychoses, migraine or pains and in particular neuropathic pains.

By pharmaceutically acceptable salt, is meant in particular the addition salts with  
30 inorganic acids such as hydrochloride, hydrobromide, hydroiodide, sulphate, phosphate, diphosphate and nitrate or with organic acids such as acetate, maleate, fumarate, tartrate, succinate, citrate, lactate, methanesulphonate, p-toluenesulphonate, pamoate and stearate. Also included in the field of the present invention, when they can be used, are the salts formed from bases such as sodium or potassium hydroxide. For other

examples of pharmaceutically acceptable salts, reference can be made to "Salt selection for basic drugs", *Int. J. Pharm.* (1986), **33**, 201-217.

The pharmaceutical composition can be in the form of a solid, for example powders, granules, tablets, gelatin capsules, liposomes or suppositories. Appropriate solid supports can be, for example, calcium phosphate, magnesium stearate, talc, sugars, lactose, dextrin, starch, gelatin, cellulose, methyl cellulose, sodium carboxymethyl cellulose, polyvinylpyrrolidine and wax.

The pharmaceutical compositions containing a compound of the invention can also be presented in liquid form, for example, solutions, emulsions, suspensions or syrups. Appropriate liquid supports can be, for example, water, organic solvents such as glycerol or glycols, similarly their mixtures, in varying proportions, in water.

The administration of a medicament according to the invention can be done by topical, oral, parenteral route, by intramuscular injection, etc.

The administration dose envisaged for a medicament according to the invention is comprised between 0.1 mg to 10 g according to the type of active compound used.

In accordance with the invention, the compounds of general formula (I) can be prepared by the processes described below.

## **PREPARATION OF THE COMPOUNDS OF THE INVENTION:**

### **Generalities**

The preparations of the compounds of the invention which correspond to general formulae (I), (II) or (III) in which  $\Omega$  represents OH are carried out in a similar fashion to those described in the PCT Patent Application WO 99/09829 and the European Patent Application EP 432 740.

As regards the compounds of the invention which correspond to general formulae (I), (II) and (III) and in which Het is an imidazole ring, a person skilled in the art can also usefully consult the PCT Patent Application WO 99/64401.

The preparations of the other compounds of the invention which correspond to general formulae (I), (II) and (III) are carried out in a similar fashion to those described in the PCT Patent Application WO 98/58934 (*cf. in particular on pages 39 to 45 of this*

document the syntheses of intermediates of general formulae (XXV) and (XXVIII)) or according to the procedures described hereafter.

### **Preparation of the compounds of general formula (I)**

5 The compounds of general formula (I) can be prepared by the 8 synthesis routes illustrated below (Diagram 1) starting from the intermediates of general formula (IV), (V), (VI), (VII), (VIII), (IX), (X) and (Ia) in which A, B,  $\Omega$ , R<sup>1</sup>, R<sup>2</sup>, Het and n are as defined above, L is a parting group such as for example a halogen, Alk is an alkyl radical, Gp is a protective group for an amine function, for example a 2-(trimethylsilyl)ethoxymethyl (SEM) group, and Gp' a protective group for an alcohol  
10 function, for example a group of benzyl, acetate or also silyl type such as *tert*-butyldimethylsilyl, and finally  $\Delta$  represents a bond or a  $-(CH_2)_x-$ ,  $-CO-(CH_2)_x-$ ,  $-(CH_2)_y-O-$  or  $-C(=NH)-$  radical. Of course, a person skilled in the art can choose to use protective groups other than Gp and Gp' from those which are known, and in particular those mentioned in: *Protective groups in organic synthesis*, 2nd ed., (John Wiley &  
15 Sons Inc., 1991).

Diagram 1

**Route 1:** Het is imidazole and  $\Omega$  is  $NR^{46}R^{47}$  but not a radical of carbamate type

The amines and carboxamides of general formula (I), Diagram 2, in which A, B,  $R^1$ ,  $R^2$ ,  $R^{46}$ ,  $R^{47}$ , Het and  $n$  are as defined above, are prepared by deprotection for example, in the case where Gp represents SEM, with *tert*-butylammonium fluoride (TBAF) in THF, of the amine of general formula (IV) in order to release the amine of the heterocycle of the compound of general formula (I). The protected amines of general formula (IV) are accessible by a general synthesis route described in *Biorg. and Med. Chem. Lett.*, 1993, 3, 915 and *Tetrahedron Lett.*, 1993. 34, 1901 and more particularly in the PCT Patent Application WO 98/58934.

**Diagram 2**

**Route 2:** Het is imidazole, oxazole or thiazole and  $\Omega$  is  $\text{NR}^{46}\text{R}^{47}$

The amines and carboxamides of general formula (I), Diagram 3, in which A, B,  $\text{R}^1$ ,  $\text{R}^2$ ,  $\text{R}^{46}$ , Het, g, k and n are as defined above,  $\Delta$  represents an alkyl, cycloalkylalkyl, arylalkyl, aryl, allenyl, allenylalkyl, alkenyl, alkynyl, cyanoalkyl or hydroxyalkyl radical and  $\Delta'$  represents an alkyl, cycloalkylalkyl, arylalkyl or aryl radical when g or k do not represent 0, or  $\Delta'$  represents an alkyl, cycloalkylalkyl, arylalkyl radical or an aryl radical preferably deactivated (i.e. an aryl radical substituted by an electron attractor group such as for example a nitro or cyano group) when g or k represents 0, are prepared by condensation of the amines of general formula (V) with carboxylic acids (or the corresponding acid chlorides) of general formula (XIII) under standard conditions of peptide synthesis, with the aldehydes of general formula (XII) in the presence of a reducing agent such as sodium triacetoxyborohydride or sodium borohydride, in a lower aliphatic alcohol such as methanol and optionally in the presence of molecular sieves, or with halogenated derivatives (Hal = halogen atom) of general formula (XI). In particular, when  $\Delta$  represents an allenyl, allenylalkyl, alkenyl, alkynyl, cyanoalkyl or hydroxyalkyl radical, the compounds of general formula (V) are converted to the corresponding compounds of general formula (I) by reaction with the halogenated derivatives of general formula (XI) in a solvent such as acetonitrile, dichloromethane or acetone and in the presence of a base such as for example triethylamine or potassium carbonate at a temperature comprised between ambient temperature and the reflux temperature of the solvent.

The derivatives of general formula (V) are in particular accessible by a general synthesis route described in *Biorg. and Med. Chem. Lett.*, 1993, **3**, 915 and *Tetrahedron Lett.*, 1993, **34**, 1901, and more particularly in the Patent Application WO 98/58934. When  $\text{R}^{46} = \text{H}$ , the compounds of general formula (V) can be prepared, for example, according to a protocol described in the Patent Application WO 98/58934 (using the appropriate amino acid in place of N-Boc-sarcosinamide).

Diagram 3

- In the particular case where  $R^{47}$  represents a cycloalkyl radical, the amines of general formula (I), Diagram 3a, in which A, B,  $R^1$ ,  $R^2$ ,  $R^{46}$ , Het and n are as defined above and i represents an integer from 0 to 4 are prepared by condensation of the amines of general formula (V) with the cycloalkylketones of general formula (XIV) in the presence of a reducing agent such as sodium triacetoxyborohydride or sodium borohydride in a lower aliphatic alcohol such as methanol and optionally in the presence of molecular sieves at ambient temperature.

Diagram 3a

- The sulphonamides of general formula (I), Diagram 3b, in which A, B,  $R^1$ ,  $R^2$ ,  $R^{46}$ , Het and n are as defined above,  $R^{47}$  represents an  $-SO_2-\Delta$  radical and  $\Delta$  represents an alkyl, cycloalkyl, cycloalkylalkyl or arylalkyl radical, are prepared by condensation of the amines of general formula (V) with the sulphochlorides of general formula (XV) under

standard conditions, for example in a solvent such as dimethylformamide at ambient temperature.

Diagram 3b

The ureas of general formula (I), Diagram 3c, in which A, B, R<sup>1</sup>, R<sup>2</sup>, R<sup>46</sup>, Het and n are as defined above, R<sup>47</sup> represents a -CO-NH-Δ radical and Δ represents an alkyl, cycloalkyl, cycloalkylalkyl or arylalkyl radical, are prepared by reaction of the amines of general formula (V) with the isocyanates of general formula (XVI) in an inert solvent such as dichloromethane or 1,2-dichloroethane.

Diagram 3c

**Route 3:** Het is oxazole or thiazole, R<sup>1</sup> and R<sup>2</sup> are both H and Ω is OH.

The alcoholic derivatives of general formula (I), Diagram 4, in which A, B, Het and n are as defined above and R<sup>1</sup> and R<sup>2</sup> are hydrogen atoms are obtained by reduction of the acids or esters of general formula (VI) (accessible by a general synthesis route described in *J. Med. Chem.*, 1996, **39**, 237-245 and the PCT Patent Application WO 99/09829). This reduction can, for example, be carried out by the action of boron hydride or lithium aluminium hydride or also diisobutylaluminium hydride in an aprotic polar solvent such as tetrahydrofuran.

Diagram 4

**Route 4:** Het is oxazole or thiazole and  $\Omega$  is  $\text{NR}^{46}\text{R}^{47}$ .

The amines of general formula (I), Diagram 5, in which A, B,  $\text{R}^1$ ,  $\text{R}^2$ ,  $\text{R}^{46}$ ,  $\text{R}^{47}$ , Het, and n are as defined above, are prepared by condensation of the primary or secondary amines of general formula  $\text{R}^{46}\text{-NHR}^{47}$  with the compounds of general formula (VII) (in which L preferably represents a halogen atom Hal, but can also represent a mesylate or tosylate group) according to a general synthesis route described in *J. Med. Chem.*, 1996, 39, 237-245 and the PCT Patent Application WO 99/09829 or the US Patent 4,123,529. This synthesis route can in particular be used when  $\text{R}^{46}$  and  $\text{R}^{47}$  taken together form with the nitrogen atom which carries them a non-aromatic heterocycle with 4 to 8 members. The reaction typically takes place in an anhydrous solvent (for example dimethylformamide, dichloromethane, tetrahydrofuran or acetone) in the presence of a base (for example  $\text{Na}_2\text{CO}_3$  or  $\text{K}_2\text{CO}_3$  in the presence of triethylamine), and preferably while heating.

Diagram 5

**Route 5:** Het is imidazole and  $\Omega$  is a radical of carbamate type

When  $\Omega$  is a radical of carbamate type, the acids of general formula (VIII) can be cyclized in the form of derivatives of imidazoles of general formula (I), Diagram 6, by the addition of caesium carbonate followed by a condensation with an  $\alpha$ -halogenoketone of formula  $\text{A-CO-CH(B)-[Br, Cl]}$  followed by the addition of a large excess of ammonium acetate (for example 15 or 20 equivalents per equivalent of acid of general formula (VIII)). This reaction is preferably carried out in a mixture of xylenes

and while heating (one can also, if appropriate, simultaneously eliminate the water formed during the reaction).

Diagram 6

**Route 6:** Het is imidazole, oxazole or thiazole and  $\Omega$  is  $\text{NR}^{46}\text{R}^{47}$

When  $\Omega$  is an  $\text{NR}^{46}\text{R}^{47}$  radical in which  $\text{R}^{47}$  is a radical comprising a termination of aminophenylene, alkylaminophenylene or dialkylaminophenylene type, the compounds of general formula (I), in which A, B, Het, n,  $\text{R}^1$ ,  $\text{R}^2$  and  $\text{R}^{46}$  are as defined above and  $\Lambda$  represents a bond or a  $-(\text{CH}_2)_x-$ ,  $-\text{CO}-(\text{CH}_2)_x-$ ,  $-(\text{CH}_2)_y-\text{O}-$  or  $-\text{C}(=\text{NH})-$  radical, x and y being integers from 0 to 6, can be obtained, Diagram 7, by reduction of the compound of general formula (IX), for example by the action of hydrogen in the presence of a catalyst of palladium on carbon type in a solvent such as for example methanol, ethanol, dichloromethane or tetrahydrofuran. Reduction of the nitro function can also be carried out, for example, by heating the product in an appropriate solvent such as ethyl acetate with a little ethanol in the presence of  $\text{SnCl}_2$  (*J. Heterocyclic Chem.* (1987), **24**, 927-930; *Tetrahedron Letters* (1984), **25** (8), 839-842) or in the presence of  $\text{SnCl}_2 / \text{Zn}$  (*Synthesis*. (1996), 9, 1076-1078), using  $\text{NaBH}_4\text{-BiCl}_3$  (*Synth. Com.* (1995) **25** (23), 3799-3803) in a solvent such as ethanol, or then by using Raney Ni with hydrazine hydrate added to it (*Monatshefte für Chemie*, (1995), **126**, 725-732), or also using indium in a mixture of ethanol and ammonium chloride under reflux (*Synlett* (1998) **9**, 1028).

When  $\text{R}^{47}$  is a radical of aminophenylene, alkylaminophenylene or dialkylaminophenylene type (Alk and Alk' are identical or different alkyl radicals), the compound of general formula (IX) is reduced in order to produce the aniline derivative of general formula (I) and optionally mono- or di-alkylated according to standard reactions known to a person skilled in the art. The mono-alkylation is carried out by reducing amination with an aldehyde or by a nucleophilic substitution by reaction with

an equivalent of halogenoalkyl Alk-Hal. A second alkylation can then be carried out if appropriate using a halogenoalkyl Alk'-Hal.

Diagram 7

In the particular case where Alk = Alk' = -CH<sub>3</sub> and where Λ does not represents -CH<sub>2</sub>-, the nitro derivative of general formula (IX) will be treated with suitable quantities of paraformaldehyde under a flow of hydrogen in a solvent such as ethanol and in the presence of a catalyst of palladium on carbon type (Diagram 7a).

Diagram 7a

**Route 7:** Het is imidazole, oxazole or thiazole and  $\Omega$  is OH

This route can be used when  $\Omega$  is OH. Contrary to route 3,  $R^1$  and  $R^2$  cannot be hydrogen atoms. In this case, the compounds of general formula (I) can be obtained, Diagram 8, by deprotection of the protected alcohol of general formula (X).

- 5 In the case where  $Gp'$  is a protective group of silyl type, the deprotection can be carried out, for example, by adding tetra-*tert*-butylammonium fluoride in a solvent such as tetrahydrofuran. In the case where  $Gp'$  is a protective group of benzyl type, the deprotection will be carried out by hydrogenation in a solvent such as for example methanol, ethanol, dichloromethane or tetrahydrofuran. In the case where  $Gp'$  is a
- 10 protective group of acetate type, the deprotection can be carried out, for example, using sodium or potassium carbonate in an alcoholic solvent such as methanol. For other cases, a person skilled in the art will usefully consult the following document: *Protective groups in organic synthesis*, 2nd ed., (John Wiley & Sons Inc., 1991).

Diagram 8

**Route 8:** Het is imidazole, oxazole or thiazole and  $\Omega$  is  $OR^{48}$  with  $R^{48} H$

- 15 The compounds of general formula (I) in which  $\Omega$  is an  $OR^{48}$  radical with  $R^{48} H$  are obtained, for example, Diagram 9, from alcohols of general formula (I)a (which are compounds of general formula (I) as defined previously in which  $\Omega$  represents OH) by reacting the latter with a halide of general formula  $R^{48}-Hal$  ( $Hal = Br, Cl$  or  $I$ ) in a solvent such as dichloromethane, acetonitrile, anhydrous tetrahydrofuran or anhydrous ether and in the presence of a base such as potassium or
- 20 sodium carbonate, sodium hydride or triethylamine.

In the case where the A, B, R<sup>1</sup> and R<sup>2</sup> radicals contain alcohol, phenol, amine or aniline functions, it may be necessary to add protection/deprotection stage for these functions according to standard methods known to a person skilled in the art (stages not represented in Diagram 9).

## 5 Preparation of the synthesis intermediates

### Preparation of the imidazoles and thiazoles of general formula (V)

#### General outline

The non-commercial ketonic derivative of general formula (V.i) or (V.ii)<sub>2</sub> in which A and B are as defined in general formula (I) is converted, Diagram 3.1, to the corresponding α-bromo-ketone of general formula (V.ii) ou (V.ii)<sub>2</sub> by reaction with a bromination agent such as CuBr<sub>2</sub> (*J. Org. Chem.* (1964), **29**, 3459), bromine (*J. Het. Chem.* (1988), **25**, 337), N-bromosuccinimide (*J. Amer. Chem. Soc.* (1980), **102**, 2838) in the presence of acetic acid in a solvent such as ethyl acetate or dichloromethane, HBr or Br<sub>2</sub> in ether, ethanol or acetic acid (*Biorg. Med. Chem. Lett.* (1996), **6**(3), 253-258; *J. Med. Chem.* (1988), **31**(10), 1910-1918) *J. Am. Chem. Soc.* (1999), **121**, 24) or also using a bromination resin (*J. Macromol. Sci. Chem.* (1977), **A11**, (3) 507-514). In the particular case where A is a p-dimethylaminophenyl radical, it is possible to use the operating method appearing in the publication *Tetrahedron Lett.*, 1998, **39** (28), 4987. The amine of general formula (V) is then obtained according to the procedures shown in Diagrams 3.2 (imidazoles) and 3.3 (thiazoles) hereafter.

Diagram 3.1

Alternatively to the synthesis shown in Diagram 3.1, a person skilled in the art can, if appropriate, use an  $\alpha$ -chloro-ketone in place of an  $\alpha$ -bromo-ketone.

Obtaining the imidazoles of general formula (V)

The acid of general formula (V.iii), in which Gp represents a protective group for an amine function, for example a protective group of carbamate type, is treated, Diagram 3.2, with  $\text{Cs}_2\text{CO}_3$  in a solvent such as methanol or ethanol. The  $\alpha$ -halogeno-ketone of general formula (V.ii) in an inert solvent such as dimethylformamide is added to the caesium salt recovered. The intermediate ketoester is cyclized by heating to reflux in xylene (mixture of isomers) in the presence of a large excess of ammonium acetate (15 or 20 equivalents for example) in order to produce the imidazole derivative of general formula (V.iv) (the water formed being optionally eliminated during the reaction).

In the case where  $\text{R}^{38}$  is not H, the amine function of the imidazole ring of the compound of general formula (V.iv) is substituted by reaction with the halogenated derivative  $\text{R}^{38}\text{-Hal}$  (Hal = halogen atom); the protected amine function is then deprotected under standard conditions (for example: trifluoroacetic acid or HCl in an organic solvent when it is a protective group of carbamate type, or also hydrogenation in the presence of palladium on carbon when the protective group is a benzyl carbamate).

Diagram 3.2

Obtaining the thiazoles of general formula (V) intended for the preparation of compounds of general formulae (I)<sub>1</sub> or (I)<sub>2</sub>.

The thiocarboxamide of general formula (V.v), in which Gp represents a protective group for an amine function, for example a protective group of carbamate type, obtained for example by reaction of the corresponding carboxamide with Lawesson reagent or with  $(\text{P}_2\text{S}_5)_2$ , is reacted, Diagram 3.3, with the  $\alpha$ -bromo-ketone of general formula (V.ii) or (V.ii)<sub>2</sub> according to an experimental protocol described in the literature (*J. Org. Chem.*, (1995), **60**, 5638-5642). The protected amine function is then deprotected under standard conditions in a strong acid medium (for example: trifluoroacetic acid or HCl in an organic solvent when it is a protective group of carbamate type), releasing the amine of general formula (V).

Diagram 3.3

Obtaining the thiazoles of general formula (V) intended for the preparation of compounds of general formula (I)<sub>3</sub>:

These compounds are obtained according to a method summarized in Diagram 3.4 below. The carboxamide of general formula (VII.ii) is firstly treated, for example, with Lawesson reagent or with (P<sub>2</sub>S<sub>5</sub>)<sub>2</sub> then the thiocarboxamide of general formula (VII.iii) obtained is reacted with the halogenated derivative of general formula (V.vii) (cf. *Biorg. Med. Chem. Lett.* (1996), **6**(3), 253-258; *J. Med. Chem.* (1988), **31**(10), 1910-1918; *Tetrahedron Lett.*, (1993), **34** (28), 4481-4484; or *J. Med. Chem.* (1974), **17**, 369-371; or also *Bull. Acad. Sci. USSR Div. Chem. Sci. (Engl Transl)* (1980) **29**, 1830-1833). The protected amine of general formula (V.viii) thus obtained is then deprotected under standard conditions for a person skilled in the art (for example: trifluoroacetic acid or HCl in an organic solvent when Gp is a protective group of carbamate type).

Diagram 3.4

Obtaining the oxazoles of general formula (V) intended for the preparation of compounds of general formula (I).

- 5 These compounds are obtained according to a method summarized in Diagram 3.5 below. The carboxamide of general formula (VII.ii) is reacted with the halogenated derivative of general formula (V.vii). The protected amine of general formula (V.ix) thus obtained is then deprotected under standard conditions for a person skilled in the art in order to produce the compound of general formula (V) (for example: trifluoroacetic acid or HCl in an organic solvent when Gp is a protective group of carbamate type).

Diagram 3.5

Preparation of the ketonic derivatives of general formula (V.i) and of certain  $\alpha$ -bromoketonic derivatives of general formula (V.ii), (V.ii), or (V.vii)

The non-commercial ketonic derivatives of general formula (V.i) or their  $\alpha$ -bromoketonic homologues are accessible from methods in the literature or similar methods adapted by a person skilled in the art. In particular:

- ♦ when A represents an indolinylyl or tetrahydroquinolyl radical, the compounds of general formula (V.i) are accessible from methods in the literature such as for example *J. Med. Chem.* (1986), **29**, (6), 1009-1015 or *J. Chem. Soc., Perkin Trans. 1* (1992), **24**, 3401-3406;
- 10 Alternatively, the compounds of general formula (V.ii) in which A represents an indolinylyl or tetrahydroquinolyl radical in which R<sup>33</sup> represents H can be synthesized according to a protocol which is slightly modified compared to that described in *J. Chem. Soc., Perkin Trans 1* (1992), **24**, 3401-3406. This protocol is summarized in Diagram 3.6 below.

Diagram 3.6

The indoline or tetrahydroquinoline (T represents  $-\text{CH}_2-$  or  $-(\text{CH}_2)_2-$ ) is protected using chloroacetyl chloride in order to produce the compound of general formula (XVII) which is subjected to a Friedel-Crafts reaction (substituted chloroacetyl chloride of general formula (XVIII), in which B has the meaning indicated previously, in a solvent such as carbon disulphide and in the presence of aluminium chloride) in order to produce the compound of general formula (XIX). Then the compound of general formula (XIX) is hydrolyzed in the presence of acid, for example an acetic acid/HCl mixture, in order to produce the compounds of general formula (V.ii) in the form of a mixture of meta and para isomers. These isomers can be separated by fractioned crystallization from a solvent such as glacial acetic acid.

A person skilled in the art will know how to adapt the syntheses described previously to the case where A represents an indolinyl or tetrahydroquinolyl radical in which  $\text{R}^{33}$  does not represent H. For example, when  $\text{R}^{33}$  represents an alkyl or aralkyl radical, the protection and deprotection stages will be unnecessary.

- ♦ when A represents a radical of 4-(4-hydroxyphenyl)-phenyl type, the compounds of general formula (V.i) are accessible from methods in the literature such as for example *J. Org. Chem.*, (1994), **59**(16), 4482-4489.

Alternatively, the compounds of general formula (V.i) and (V.ii) in which A represents a radical of 4-(4-hydroxyphenyl)-phenyl type are accessible for example by the method illustrated in Diagram 3.7 below.

**Diagram 3.7**

The compounds of general formula (V.i) or (V.ii), in which  $S_1, S_2, S_3$  and  $S_4$  are chosen independently from a hydrogen atom and OH, cyano, nitro, alkyl, alkoxy or  $-\text{NR}^{10}\text{R}^{11}$  as defined in general formula (I), are prepared, Diagram 3.7, from the esters of general formula (XX) (cf. in particular *Chem. Lett.* (1998), **9**, 931-932 and *Synthesis* (1993), **8**, 788-790). Of course, the phenol or aniline functions resulting from the nature of the  $R^{19}, R^{20}, R^{21}, S_1, S_2, S_3$  and  $S_4$  substituents can lead a person skilled in the art to add to the stages represented in Diagram 3.7 protection stages (and, subsequently in the synthesis of the compounds of general formula (I), deprotection stages) of these functions so that they do not interfere with the remainder of the chemical synthesis. The esters of general formula (XX) are

hydrolyzed in order to produce the acids of general formula (XXI). The latter are then subjected to coupling with N,O-dimethylhydroxylamine (*Syn. Commun.* (1995), **25**(8), 1255; *Tetrahedron Lett.* (1999), **40**(3), 411-414) in a solvent such as dimethylformamide or dichloromethane, in the presence of a base such as triethylamine with dicyclohexylcarbodiimide or 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride and hydroxybenzotriazole, in order to produce the intermediates of general formula (XXII). The compounds of general formula (V.i) are prepared from the compounds of general formula (XXII) by a substitution reaction with MeLi (*J. Med. Chem.* (1992), **35**(13), 2392). The bromoacetophenones of general formula (V.ii) are now accessible from the acetophenone of general formula (V.i) under the conditions described previously.

- ◆ when A represents a carbazolyl radical, the compounds of general formula (V.i) are accessible from methods in the literature such as for example *J. Org. Chem.*, (1951), **16**, 1198 or *Tetrahedron* (1980), **36**, 3017.

Alternatively, the compounds of general formula (V.ii) in which A represents a carbazolyl radical in which R<sup>9</sup> represents H can be synthesized according to a protocol which is slightly modified with respect to that described for A = carbazolyl in *Tetrahedron* (1980), **36**, 3017. This method is summarized in Diagram 3.8 hereafter:

**Diagram 3.8**

The carbazole of general formula (XXIII) is protected using acetic anhydride in order to produce the compound of general formula (XXIV), which is subjected to a Friedel-Crafts reaction (substituted chloroacetyl chloride of general formula (XVIII) as defined previously in a solvent such as carbon disulphide and in the presence of aluminium chloride) in order to produce the compound of general formula (XXV).

Then the acyl group protecting the amine function is hydrolyzed in the presence of acid, for example an AcOH/HCl mixture, in order to produce the compound of general formula (V.ii). When A represents a carbazolyl radical in which R<sup>9</sup> represents alkyl or a -COR<sup>15</sup> group (case not shown in Diagram 3.8), the initial acylation stage is unnecessary and the last two stages of Diagram 3.8 allow the compounds of general formula (V.ii) to be obtained. Of course, the phenol or aniline functions resulting from the nature of the R<sup>4</sup>, R<sup>5</sup>, R<sup>6</sup>, R<sup>7</sup> and R<sup>8</sup> substituents can lead a person skilled in the art to add to the stages represented in Diagram 3.8 protection stages (and, subsequently in the synthesis of the compounds of general formula (I), deprotection stages) of these functions so that they do not interfere with the remainder of the chemical synthesis.

- ◆ when A represents a phenothiazinyl radical, the intermediates of general formula (V.i) and (V.ii) are accessible from methods in the literature: *J. Heterocyclic. Chem.* (1978), **15**, 175-176 and *Arzneimittel Forschung* (1962), **12**, 48.

Alternatively, the intermediates of general formula (V.ii) in which A represents a phenothiazinyl radical can be prepared according to a protocol which is slightly modified with respect to that described for the phenothiazinyl radical in *Arzneimittel Forschung* (1962), **12**, 48, which is summarized in Diagram 3.9 hereafter (see also the examples). The phenothiazine of general formula (XXVI) is protected using chloroacetyl chloride in order to produce the compound of general formula (XXVII), which is then subjected to a Friedel-Crafts reaction (compound of general formula (XVIII) in a solvent such as carbon disulphide in the presence of aluminium chloride) in order to produce the compound of general formula (XXVIII). During the last stage of the process, hydrolysis with HCl/acetic acid is accompanied by a halogen exchange and allows the chloroketone of general formula (V.ii) to be obtained. Of course, the phenol or aniline functions resulting from the nature of the R<sup>4</sup>, R<sup>5</sup>, R<sup>6</sup>, R<sup>7</sup> and R<sup>8</sup> substituents can lead a person skilled in the art to add to the stages shown in Diagram 3.9 protection stages (and, subsequently in the synthesis of the compounds of general formula (I), deprotection stages) of these functions so that they do not interfere with the remainder of the chemical synthesis.

Diagram 3.9

- ♦ when A represents a phenylaminophenyl radical, the compounds of general formula (V.i) are accessible from methods in the literature such as for example *Chem. Commun.*, (1998), **15**, (6) 1509-1510 or *Chem Ber.*, (1986), **119**, 3165-3197, or similar methods which a person skilled in the art will have adapted.

5 For example, the intermediates of general formula (V.i)a and (V.ii)a in which A represents a phenylaminophenyl radical (which correspond to the corresponding compounds of general formula (V.i) and (V.ii) the aniline function of which has been acetylated), can be prepared according to a protocol which is slightly modified with respect to that described for the phenylaminophenyl radical in *Chem Ber.*

10 (1986), **119**, 3165-3197. This protocol is summarized in Diagram 3.10 hereafter.

Diagram 3.10

In the case (shown in Diagram 3.10) where the R<sup>9</sup> radical of the compound of general formula (I) to be synthesized is a hydrogen atom or an acetyl group, the diphenylamine of general formula (XXIX) formed after the coupling reaction in the presence of CuI is protected by acetylation using, for example, acetic anhydride in order to produce the compound of general formula (V.i)a. In the case (not shown in Diagram 3.10) where the R<sup>9</sup> radical of the compound of general formula (I) to be synthesized is not a hydrogen atom or an acetyl radical, the acetylation stage is replaced by a substitution stage of the aniline according to standard methods known to a person skilled in the art in order to produce the corresponding compound of general formula (V.i). The compound of general formula (V.i)a (or (V.i)), in the case not shown in Diagram 3.10) is then subjected to a bromination reaction using a bromination resin, PVPHP resin (*Poly(VinylPyridinium Hydrobromide Perbromide)*), described in *J. Macromol. Sci. Chem.* (1977), **A11**, (3), 507-514, in order to produce the compound of general formula (V.ii)a (or (V.ii)), in the case not shown in Diagram 3.10). Of course, the phenol or aniline functions resulting from the nature of the R<sup>4</sup>, R<sup>5</sup>, R<sup>6</sup>, R<sup>7</sup> and R<sup>8</sup> substituents can lead a person skilled in the art to add to the stages shown in Diagram 3.10 protection stages (and, subsequently in the synthesis of the compounds of general formula (I), deprotection stages) of these functions so that they do not interfere with the remainder of the chemical synthesis. The deprotection of the acetylated aniline function will be carried out in principle during the last stage of the synthesis of the compounds of general formula (I).

- ◆ when A represents a benzopyran or benzofuran radical as defined in general formula (I) with R<sup>32</sup> representing a hydrogen atom, the intermediates of general formula (V.i) and (V.ii) are accessible by the methods illustrated in Diagram 3.11 below.

**Diagram 3.11**

The compounds of general formulae (V.i) and (V.ii), according to Diagram 3.11, in which T is as defined above and Gp = protective group, are prepared from the acids of general formula (XXX). The acids of general formula (XXX) are subjected to coupling with N,O-dimethylhydroxylamine (*Syn. Commun.* (1995), **25**, (8), 1255; *Tetrahedron Lett.* (1999), **40**, (3), 411-414) in a solvent such as dimethylformamide or dichloromethane, in the presence of a base such as triethylamine with dicyclohexylcarbodiimide or 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride and hydroxybenzotriazol, in order to produce the intermediates of general formula (XXXI). The protection of the phenol function in the form of a benzylated or *tert*-butyldimethylsilylated derivative or by other protective groups (Gp) known to a person skilled in the art is then carried out in order to produce the compounds of general formula (XXXII). The compounds of general formula (V.i) are prepared from the compounds of general formula (XXXII) by a substitution reaction with a Grignard reagent, MeMgCl (*J. Het. Chem.* (1990), **27**, 1709-1712) or with MeLi (*J. Med. Chem.* (1992), **35**, 13). The bromoacetophenones of general

formula (V.ii) are now accessible from the acetophenone of general formula (V.i) under previously described conditions.

Alternatively, the compound of general formula (V.ii) in which  $R^{32}$  represents a hydrogen atom or an alkyl radical can be prepared according to a process in only 3 stages (cf. Diagram 3.12 – see also the examples). In this process, the bromination in the last stage of the compound of general formula (V.i) in order to produce the compound of general formula (V.ii) will preferably be carried out according to *J. Am. Chem. Soc.* (1999), **121**, 24.

**Diagram 3.12**

When A represents a substituted phenol radical, it can be necessary to use intermediates of general formula (V.ii) as defined previously the phenol function of which has been acetylated (hereafter designated as compounds of general formula (V.ii)b). In particular:

- ◆ when A represents a 4-hydroxy-3,5-diisopropylphenyl radical, the homologous  $\alpha$ -bromoketonic derivatives of the compound of formula (V.ii) the phenol function of which is protected by an acetyl radical can be prepared as summarized in Diagram 3.13 hereafter.

Diagram 3.13

2,6-diisopropylphenol is acetylated according to methods known to a person skilled in the art, for example by reacting it with acetic acid in the presence of trifluoroacetic acid anhydride or with acetyl chloride in the presence of a base such as for example  $\text{K}_2\text{CO}_3$ . The acetylated homologue of 2,6-diisopropylphenol is then subjected to a Fries rearrangement in the presence of aluminium chloride in a solvent such as nitrobenzene in order to produce the compound of formula (V.i). Then the compound of formula (V.i) is acetylated in order to produce the compound of formula (V.i)b. Bromination is then carried out with  $\text{CuBr}_2$  as previously described in order to produce the compound of formula (V.ii)b. The deprotection stage to release the phenol function will occur subsequently in the synthesis of the compounds of general formula (I) (at the time considered most appropriate by a person skilled in the art).

- ♦ when A represents a radical of dimethoxyphenol type, the compounds of general formula (V.ii)b can be prepared in a similar fashion to the synthesis described for the compound of formula (V.ii)b derived from 2,6-diisopropylphenol, optionally with a few minor modifications within the scope of a person skilled in the art. For example, when A represents the 3,5-dimethoxy-4-hydroxyphenyl radical, the corresponding  $\alpha$ -bromoketonic derivative of formula (V.ii)b can be prepared, for example, as indicated in Diagram 3.13 from the commercial compound of formula (XXXV):

**Diagram 3.14**

The compounds of general formula (V.ii)<sub>2</sub> in which A and B are as defined previously can be prepared according to the method summarized in Diagram 3.15 hereafter.

**Diagram 3.15**

The acids of general formula (XXXVI) are subjected to coupling with N,O-dimethylhydroxylamine (*Syn. Commun.* (1995), **25**, (8), 1255; *Tetrahedron Lett.* (1999), **40**, (3), 411-414) in a solvent such as dimethylformamide or dichloromethane, in the presence of a base such as triethylamine with dicyclohexylcarbodiimide or 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride and hydroxybenzotriazol, in order to produce the intermediates of general formula (XXXVII). The compounds of general formula (V.i)<sub>2</sub> are prepared from the compounds of general formula (XXXVII) by a substitution reaction with lithium compound or magnesium compound derivatives of general formula B-M in which M represents Li or MgHal (Hal = I, Br or Cl) in solvents such as ether or anhydrous tetrahydrofuran. The α-bromo- or α-chloro ketones of general formula (V.ii)<sub>2</sub> can now be accessed from the ketones of general formula (V.i)<sub>2</sub> under the conditions previously described.

Moreover, the non commercial  $\alpha$ -halogenoketonic derivatives of general formula (V.vii) are accessible from methods in the literature. In particular, they can be obtained according to a procedure summarized in Diagram 3.16.

Diagram 3.16

- 5 The protected amino acids of general formula (XXXVIII) are obtained by protection of the corresponding amino acids by a group of carbamate type according to methods known to a person skilled in the art. The acids of general formula (XXXVIII) are then subjected to coupling with N,O-dimethylhydroxylamine (*Syn. Commun.* (1995), **25**, (8), 1255; *Tetrahedron Lett.* (1999), **40**, (3), 411-414) in a solvent such as
- 10 dimethylformamide or dichloromethane, in the presence of a base such as triethylamine with dicyclohexylcarbodiimide or 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride and hydroxybenzotriazole, in order to produce the intermediates of general formula (XXXIX). The compounds of general formula (XLI) are prepared from the compounds of general formula (XXXIX) by a substitution reaction with
- 15 lithium compound or magnesium compound derivatives of general formula (XL) (in which Hal = I, Br or Cl) in solvents such as ether or anhydrous tetrahydrofuran. The bromo or chloroacetophenones of general formula (V.vii) are now accessible from the acetophenone of general formula (XLI) under the conditions previously described.

Alternatively, a person skilled in the art can also use or adapt the syntheses described in *Angew. Chem. Int.* (1998), **37** (10), 411-414, *Liebigs Ann. Chem.* (1995), 1217 or *Chem. Pharm. Bull.* (1981), **29**(11), 3249-3255.

Preparation of the acid derivatives of general formula (V.iii)

The acid derivatives of general formula (V.iii) can be obtained, Diagram 3.17, directly by reaction of the commercial amino acid of general formula (V.vi) with the compounds of (ar)alkylchloroformate or di(ar)alkylcarbonate type ( $\Delta$  represents an alkyl or benzyl radical) under standard conditions known to a person skilled in the art.

Diagram 3.17

Preparation of the compounds of general formula (V.v)

The thiocarboxamides of general formula (V.v) can be obtained in three stages starting from the compounds of general formula (V.vi) as indicated in the Diagram 3.18 below. The amine function of the amino acid of general formula (V.vi) is firstly protected under standard conditions with tBu-O-CO-Cl or (tBu-O-CO)<sub>2</sub>O (or other protective groups known to a person skilled in the art), then the intermediate obtained is converted to its corresponding amide by methods described in the literature (cf. for example, *J. Chem. Soc., Perkin Trans. 1*, (1998), **20**, 3479-3484 or the PCT Patent Application WO 99/09829). Finally, the carboxamide is converted to the thiocarboxamide of general formula (V.v), for example by reaction with Lawesson reagent in a solvent such as dioxane or tetrahydrofuran at a temperature preferably comprised between ambient temperature and the reflux temperature of the mixture, or also using (P<sub>2</sub>S<sub>5</sub>)<sub>2</sub> under standard conditions for a person skilled in the art.

Diagram 3.18

Alternatively, the thiocarboxamides of general formula (V.v) can also be obtained, Diagram 3.19, by the addition of  $H_2S$  on the corresponding cyano derivatives of general formula (V.x) under standard conditions known to a person skilled in the art.

### Preparation of the acids of general formula (VI)

#### 5 Preparation of the acid derivatives of thiazoles of general formula (VI)

The acids of general formula (VI) derived from thiazoles can be prepared according to the procedures represented in Diagram 4.1 below.

Diagram 4.1

The carboxamides of general formula (VII.ii) are treated under standard conditions in order to produce the thiocarboxamide of general formula (VII.iii), for example by Lawesson reagent or also using  $(P_2S_5)_2$  under standard conditions for a person skilled in the art. Alternatively the acid of general formula (VII.i) is activated by the action of 1.1'-carbonyldiimidazole then treated with methylamine in an aprotic polar solvent such as for example tetrahydrofuran. The carboxamide intermediate obtained is converted to the thiocarboxamide of general formula (VI.i) under standard conditions, for example using Lawesson reagent or also using  $(P_2S_5)_2$  under standard conditions for a person skilled in the art. The thiocarboxamide of general formula (VII.iii) or (VI.i) is then reacted with the compound of general formula (VI.ii), for example while heating at reflux in a solvent such as benzene, dioxane or dimethylformamide. The ester of general formula (VI.iii) obtained can then be saponified by the action of a base such as for example potash in alcoholic medium or LiOH in tetrahydrofuran in order to produce the acid of general formula (VI).

15 Preparation of the acid derivatives of oxazoles of general formula (VI)

The acids of general formula (VI) derived from oxazoles can be prepared according to a procedure represented in Diagram 4.2 below.

Diagram 4.2

The carboxamides of general formula (VII.ii) are reacted with the compound of general formula (VI.ii) while heating, for example at reflux, in the absence or in the presence of a solvent such as dimethylformamide. The ester of general formula (VI.iv) obtained can then be saponified by the action of a base such as for example potash in alcoholic

medium or LiOH in tetrahydrofuran in order to produce the acid of general formula (VI).

Preparation of the acid derivatives of isoxazolines of general formula (VI)

The acid derivatives of isoxazolines of general formula (VI), used in the preparation of compounds of general formula (I)<sub>4</sub>, can be prepared according to a procedure represented in Diagram 4.3 below.

**Diagram 4.3**

The acids of general formula (VI) derived from isoxazolines can be prepared as follows: the commercial aldehydes of general formula (VI.v) are reacted with hydroxylamine hydrochloride. The oxime of general formula (VI.vi) thus obtained is activated in the form of oxime chloride, of general formula (VI.vii), by reaction with N-chlorosuccinimide in DMF before reacting with the esters of general formula (VI.viii) (in which Alk represents an alkyl radical) in order to produce the isoxazoline derivatives according to an experimental protocol described in the literature (*Tetrahedron Lett.*, 1996, **37** (26), 4455; *J. Med. Chem.*, 1997, **40**, 50-60 and 2064-2084). Saponification of the isoxazolines of general formula (VI.ix) is then carried out in a standard fashion (for example by the action of KOH in an alcoholic solvent or

LiOH in a solvent such as tetrahydrofuran) in order to produce the acid derivative of general formula (VI).

The non-commercial unsaturated esters of general formula (VI.x) can be prepared according to the methods described in the literature (*J. Med. Chem.*, 1987, **30**, 193; *J. Org. Chem.*, 1980, **45**, 5017).

### Preparation of the thiazoles and oxazoles of general formula (VII)

#### General outline

The acids of general formula (VII.i), Diagram 5.1, are converted to the corresponding carboxamides of general formula (VII.ii) by methods described in the literature (cf. for example, *J. Chem. Soc., Perkin Trans. 1*, (1998), **20**, 3479-3484 or the PCT Patent Application WO 99/09829). The compounds of general formula (VII) can then be obtained in a standard fashion according to the procedures represented in Diagrams 5.2 and 5.3 (thiazoles) and Diagram 5.4 (oxazoles) hereafter.

This synthesis route is useful for then preparing the compounds corresponding to general sub-formulae (I)<sub>1</sub> and (I)<sub>3</sub>.

Diagram 5.1

#### Obtaining the thiazoles of general formula (VII)

When R<sup>1</sup> and R<sup>2</sup> both represent H, the thiazoles of general formula (VII) intended for the preparation of compounds of general formula (I)<sub>3</sub> can be prepared according to the method summarized in Diagram 5.2. The carboxamide of general formula (VII.ii) is converted to the corresponding thiocarboxamide of general formula (VII.iii) in the presence of Lawesson reagent in a solvent such as dioxane or benzene at a temperature preferably comprised between ambient temperature and that of reflux of the mixture. The thiocarboxamide of general formula (VII.iii) is then treated with the α-halogenoketoester of general formula (VII.iv) in which Alk represents an alkyl radical (for example methyl, ethyl or *tert*-butyl), in order to produce the ester of general formula (VII.v), which is reduced to the corresponding alcohol of general formula (VII.vi), for example by the action of lithium aluminium hydride or

diisobutylaluminium hydride in a solvent such as tetrahydrofuran. This latter can then be converted to a halogenated derivative of general formula (VII) according to the methods known to a person skilled in the art, for example, in the case of a brominated derivative ( $L = Br$ ), by reaction with  $CBr_4$  in the presence of triphenylphosphine in dichloromethane at ambient temperature.

Diagram 5.2

The thiazoles of general formula (VII) intended for the preparation of compounds of general formula (I)<sub>1</sub> can be prepared according to the method summarized in Diagram 5.3. The cyano derivative of general formula (VII.vii) in which Gp' is a protective group for an alcohol function (for example a benzyl or  $-CO-p$  group in which  $p$  represents alkyl, for example methyl or *tert*-butyl) is converted to the corresponding thiocarboxamide of general formula (VII.viii) by the action of  $H_2S$  in a solvent such as ethanol in the presence of triethanolamine at a temperature preferably comprised between ambient temperature and that of reflux of the mixture. The thiocarboxamide of general formula (VII.viii) is then treated with the  $\alpha$ -halogenoketone of general formula (VII.ix) in order to produce the compound of general formula (VII.x), which is deprotected in order to produce the corresponding alcohol of general formula (VII.xi) according to methods known to a person skilled in the art (for example when Gp' is a protective group of acetate type, this is removed *in situ* by the action of an aqueous solution of sodium carbonate). This latter can then be converted to a halogenated

derivative of general formula (VII) according to the methods known to a person skilled in the art, for example, in the case of a brominated derivative (L = Br), by reaction with  $\text{CBr}_4$  in the presence of triphenylphosphine in dichloromethane at ambient temperature.

Diagram 5.3

Obtaining the oxazoles of general formula (VII)

- 5 When  $\text{R}^1$  and  $\text{R}^2$  both represent H, the oxazoles of general formula (VII) intended for the preparation of compounds of general formula (I), can be prepared according to the method summarized in Diagram 5.4. The carboxamide of general formula (VII.ii) is treated with the  $\alpha$ -halogenoketoester of general formula (VII.iv) in which Alk represents an alkyl radical (for example methyl, ethyl or *tert*-butyl), in order to produce
- 10 the ester/acid of general formula (VII.xii). This latter is reduced to the corresponding alcohol of general formula (VII.xiii), for example by the action of lithium and aluminium hydride or diisobutylaluminium hydride in a solvent such as tetrahydrofuran when one starts from the ester or by the action of diborane in tetrahydrofuran when one starts from the acid. This latter can then be converted to a halogenated derivative of
- 15 general formula (VII) according to methods known to a person skilled in the art, for example, in the case of a brominated derivative (L = Br), by reaction with  $\text{CBr}_4$  in the presence of triphenylphosphine in dichloromethane at ambient temperature.

The non-commercial acids of general formula (VII.i) are accessible from methods in the literature. In particular:

- when A represents a phenothiazinyl radical, the acids of general formula (VII.i) are accessible from methods in the literature such as for example *J. Med. Chem.* (1992), **35**, 716-724, *J. Med. Chem.* (1998), **41**, 148 –156; *Synthesis* (1988) 215-217; or *J. Chem. Soc. Perkin. Trans. 1* (1998), 351-354;
- when A represents an indoliny radical, the acids of general formula (VII.i) are accessible from methods in the literature such as for example *J. Het. Chem.* (1993), **30**, 1133-1136 or *Tetrahedron* (1967), **23**, 3823;

Chem. Soc.* (1934), 1142-1144; *J. Chem. Soc.* (1945), 945-956; or *Can. J. Chem. Soc.* (1982), 945-956; and
- when A represents a radical of 4-(4-hydroxyphenyl)-phenyl type, reference will be made for example to the following publication: *Synthesis* (1993) 788-790.

### Preparation of the compounds of general formula (VIII)

When  $R^1$  and  $R^2$  both represent H, the protected amino acids of general formula (VIII) are either commercial, or obtained by protection of commercial amino acids by a group of carbamate type according to the methods known to a person skilled in the art.

- 5 When at least one of  $R^1$  and  $R^2$  is not H, and  $n = 0$ , the protected amino acids of general formula (VIII) are obtained in one stage, Diagram 6.1, by alkylation, in a solvent such as tetrahydrofuran and at low temperature, of commercial compound of general formula (VIII.i) using 3 equivalents of butyllithium and approximately one equivalent of the halogenated derivative of general formula (VIII.ii) in which  $R^1$  represents a radical of
- 10 alkyl, cycloalkyl, cycloalkylalkyl or arylalkyl type and Hal a halogen atom. Depending on the case, a second alkylation (not represented in Diagram 6.1) can be carried out in a similar fashion, thus allowing the compounds of general formula (VIII) to be obtained in which neither  $R^1$  nor  $R^2$  represents H.

### Preparation of the imidazoles, thiazoles and oxazoles of general formula (IX)

- 15 The preparation of the intermediates of general formula (IX) is described in the Patent Application WO 98/58934 (cf. in particular pages 10 to 50 and the examples of this document) or carried out by analogy from commercial starting products

### Preparation of the protected alcohols of general formula (X)

#### Preparation of the compounds of general formula (X) derived from imidazoles

- 20 The acid of general formula (X.i) is successively treated, Diagram 8.1, with  $\text{Cs}_2\text{CO}_3$ , the compound of general formula (V.ii) and with  $\text{NH}_4\text{OAc}$ , in order to produce the compound of general formula (X). The reaction conditions are similar to those described above for this type of synthesis.

Diagram 8.1

Preparation of the compounds of general formula (X) derived from thiazoles

The cyano derivative of general formula (X.ii) is treated, Diagram 8.2, with H<sub>2</sub>S in order to produce the thiocarboxamide of general formula (X.iii), which, condensed with the compound of general formula (V.ii), allows the compound of general formula (X) to be obtained. The reaction conditions are similar to those described above (Diagram 5.3) for this type of synthesis.

## **EXAMPLES**

### **Example 1: 4-[3,5-bis(1,1-dimethylethyl)-4-hydroxyphenyl]-N-methyl-2-thiazolemethanamine:**

This product is obtained according to the procedure described in the PCT Patent Application WO 98/58934. Alternatively, it can also be prepared according to the method described below.

#### *1.1) N-Boc-sarcosinamide:*

15.0 g (0.120 mol) of sarcosinamide hydrochloride (N-Me-Gly-NH<sub>2</sub>.HCl) is dissolved in dichloromethane containing 46.2 ml (0.265 mol) of diisopropylethylamine. The mixture is cooled down to 0 °C then Boc-O-Boc (28.8 g; 0.132 mol) is added in fractions and the mixture is stirred overnight at ambient temperature. The reaction medium is then poured into ice-cooled water followed by extraction with dichloromethane. The organic phase is washed successively with a 10% aqueous solution of sodium bicarbonate and with water, then finally with a saturated solution of sodium chloride. The organic phase is then dried over magnesium sulphate, filtered and concentrated under vacuum. The product obtained is purified by crystallization from diisopropyl ether in order to produce a white solid with a yield of 72%. Melting point: 103 °C.

#### *1.2) 2-([(1,1-dimethylethoxy)carbonyl]methyl)amino-ethanethioamide:*

16.0 g (0.085 mol) of intermediate 1.1 is dissolved in dimethoxyethane (500 ml) and the solution obtained is cooled down to 5 °C. Sodium bicarbonate (28.5 g; 0.34 mol) then, in small portions, (P<sub>2</sub>S<sub>5</sub>)<sub>2</sub> (38.76 g; 0.17 mol) are added. The reaction medium is allowed to return to ambient temperature under stirring over 24 hours. After evaporation of the solvents under vacuum, a 10% aqueous solution of sodium bicarbonate is added to the residue and the solution is extracted using ethyl acetate. The organic phase is washed successively with a 10% aqueous solution of sodium bicarbonate and with water, then finally with a saturated solution of sodium chloride. The organic phase is then dried over magnesium sulphate, filtered and concentrated under vacuum. The product obtained is purified by crystallization from ether in order to produce a white solid with a yield of 65%. Melting point: 150-151 °C.

#### *1.3) 4-[3,5-bis(1,1-dimethylethyl)-4-hydroxyphenyl]-N-[(1,1-dimethylethoxy)-carbonyl]-N-methyl-2-thiazolemethanamine:*

The reaction medium is heated under reflux for 4 hours. After evaporation of the solvents, the residue is diluted with dichloromethane and washed with a saturated solution of NaCl. The organic phase is separated, dried over magnesium sulphate, filtered and concentrated under vacuum. The expected product is obtained after chromatography on a silica column (eluent: 20% ethyl acetate in heptane) in the form of an oil which crystallizes very slowly in a refrigerator with a yield of 28%. Melting point: 126.5-127.3 °C.

hydrochloride

0.8 ml (1.57 mmol) of dimethylamine and 0.4 ml (2.62 mmol) of triethylamine are dissolved in dimethylformamide (15 ml). 0.400 g (1.05 mmol) of intermediate 336.1 dissolved in dimethylformamide (5 ml) is added then the mixture is stirred at ambient temperature for 18 hours. The reaction medium is then poured into ice-cooled water followed by extraction with ethyl acetate. The expected product is obtained after chromatography on a silica column (eluent: 50% of ethyl acetate in heptane), in order to produce an orange oil with a yield of 92%. The hydrochloride is then obtained by solubilizing the base in ether and adding 1.2 ml of a 1N solution of HCl in ether. After filtering and washing of the solid formed with ether then with isopentane, a beige-pink solid is obtained with a yield of 15.2%. Melting point: 166.8-169.0 °C.

## **Pharmacological study of the products of the invention**

### **Study of the effects on the bond of a specific ligand of MAO-B, [<sup>3</sup>H]Ro 19-6327**

The inhibitory activity of the products of the invention is determined by measurement of their effects on the bond of a specific ligand of MAO-B, [<sup>3</sup>H]Ro 19-6327.

#### **5 a) Mitochondrial preparation of the cortex of rats**

The mitochondrial preparation of the cortex of rats is carried out according to the method described in Cesura A M, Galva M D, Imhof R and Da Prada M, *J. Neurochem.* **48** (1987), 170-176. The rats are decapitated and their cortex is removed, homogenized in 9 volumes of a 0.32 M sucrose buffer, buffered to pH 7.4 with 5 mM of HEPES, then  
10 centrifuged at 800 g for 20 minutes. The supernatants are recovered and the pellets are washed twice with the 0.32 M sucrose buffer as previously. The collected supernatants are centrifuged at 10000g for 20 minutes. The pellets obtained are suspended in a Tris buffer (50 mM Tris, 130 mM NaCl, 5 mM KCl, 0.5 mM EGTA, 1 mM MgCl<sub>2</sub>, pH 7.4) and centrifuged at 10000g for 20 minutes. This stage is repeated twice, and the final  
15 pellet, corresponding to the mitochondrial fraction, is stored at -80 °C in the Tris buffer. The proteinic content of the preparation is determined by the Lowry method.

#### **b) Bond of [<sup>3</sup>H]Ro 19-6327**

100 µl of the mitochondrial preparation (2 mg protein/ml) are incubated for 1 hour at 37 °C in an Eppendorf tube, in the presence of 100 µl of [<sup>3</sup>H] Ro 19-6327 (33 nM, final  
20 concentration) and 100 µl of Tris buffer containing or not containing the inhibitors. The reaction is stopped by the addition of 1 ml of unlabelled Tris buffer into each tube, then the samples are centrifuged for 2 minutes at 12000 g. The supernatants are removed by suction and the pellets washed with 1 ml of Tris buffer. The pellets are then solubilized in 200 µl of sodium dodecyl sulphate (20% weight/volume) for 2 hours at 70 °C. The  
25 radioactivity is determined by counting the samples using liquid scintillation.

#### **c) Results**

The compounds of Examples 1, 3, 6, 22, 24, 26 to 29, 323 and 332 described above show an IC<sub>50</sub> lower than 10 µM.

### **Study of the effects on lipidic peroxidation of the cerebral cortex of the rat**

30 The inhibitory activity of the products of the invention is determined by measuring their effects on the degree of lipidic peroxidation, determined by the concentration of

malondialdehyde (MDA). The MDA produced by peroxidation of unsaturated fatty acids is a good indication of lipidic peroxidation (H Esterbauer and KH Cheeseman, *Meth. Enzymol.* (1990) **186**: 407-421). Male Sprague Dawley rats weighing 200 to 250 g (Charles River) were sacrificed by decapitation. The cerebral cortex is removed, then  
5 homogenized using a Thomas potter in a 20 mM Tris-HCl buffer, pH = 7.4. The homogenate is centrifuged twice at 50000 g for 10 minutes at 4°C. The pellet is stored at -80°C. On the day of the experiment, the pellet is resuspended at a concentration of 1 g/ 15 ml and centrifuged at 515 g for 10 minutes at 4° C. The supernatant is used immediately to determine the lipidic peroxidation. The homogenate of rat's cerebral  
10 cortex (500 µl) is incubated at 37°C for 15 minutes in the presence of the compounds to be tested or of the solvent (10 µl). The lipidic peroxidation reaction is initiated by adding 50 µl of FeCl<sub>2</sub> at 1 mM, EDTA at 1 mM and ascorbic acid at 4 mM. After incubation for 30 minutes at 37°C, the reaction is stopped by adding 50 µl of a solution of hydroxylated di-tert-butyl toluene (BHT, 0.2 %). The MDA is quantified using a  
15 colorimetric test, by reacting a chromogenic reagent (R), N-methyl-2-phenylindol (650 µl) with 200 µl of the homogenate for 1 hour at 45° C. The condensation of an MDA molecule with two molecules of reagent R produces a stable chromophore the maximum absorbance wavelength of which is equal to 586 nm. (Caldwell et al. *European J. Pharmacol.* (1995) **285**, 203-206). The compounds of Examples 1 to 3, 6  
20 to 17, 20 to 30, 320, 321, 323, 331 and 332 described above show an IC<sub>50</sub> lower than 10 µM.

#### Bond test on the cerebral sodium channels of the cortex of the rat

The test consists in measuring the interaction of the compounds vis-à-vis the bond of  
25 tritiated batrachotoxin on the voltage-dependent sodium channels according to the protocol described by Brown (*J. Neurosci.* (1986), **6**, 2064-2070).

#### *Preparation of homogenates of cerebral cortices of the rat*

The cerebral cortices of Sprague-Dawley rats weighing 230-250 g (Charles River, France) are removed, weighed and homogenized using a Potter homogenizer provided  
30 with a teflon piston (10 strokes) in 10 volumes of isolation buffer the composition of which is as follows (sucrose 0.32 M; K<sub>2</sub>HPO<sub>4</sub> 5 mM; pH 7.4). The homogenate is subjected to a first centrifugation at 1000 g for 10 minutes. The supernatant is removed and centrifuged at 20000 g for 15 minutes. The pellet is taken up in the isolation buffer and centrifuged at 20000 g for 15 minutes. The pellet obtained is resuspended in  
35 incubation buffer (HEPES 50 mM; KCl 5.4 mM; MgSO<sub>4</sub> 0.8 mM; glucose 5.5 mM; choline chloride 130 mM pH 7.4) then aliquoted and stored at -80 °C until the day of

assay. The final protein concentration is comprised between 4 and 8 mg/ml. The assay of proteins is carried out using a kit marketed by BioRad (France).

*Measurement of the bond of tritiated batrachotoxin*

The bond reaction is carried out by incubating for 1 hour 30 minutes at 25 °C 100 µl of  
5 homogenate of rat cortex containing 75 µg of proteins with 100 µl of [<sup>3</sup>H]  
batrachotoxin-A 20-alpha benzoate (37.5 Ci/mmol, NEN) at 5 nM (final concentration),  
200 µl of tetrodotoxin at 1 µM (final concentration) and scorpion venom at 40 µg/ml  
(final concentration) and 100 µl of incubation buffer alone or in the presence of the  
products to tested at different concentrations. The non-specific bond is determined in  
10 the presence of 300 µM of veratridine and the value of this non-specific bond is  
subtracted from all the other values. The samples are then filtered using a Brandel  
(Gaithersburg, Maryland, USA) using Unifilter GF/C plates pre-incubated with 0.1 %  
of polyethylene imine (20 µl/well) and rinsed twice with 2 ml of filtration buffer  
(HEPES 5 mM; CaCl<sub>2</sub> 1.8 mM; MgSO<sub>4</sub> 0.8 mM; choline chloride 130 mM; BSA 0.01  
15 %; pH 7.4). After having added 20 µl of Microscint 0<sup>®</sup>, the radioactivity is counted  
using a liquid scintillation counter (Topcount, Packard). The measurement is carried  
out in duplicate. The results are expressed as a % of the specific bond of tritiated  
batrachotoxin relative to the control.

(54) Titre: DERIVES D'HETEROCYCLES A 5 CHAINONS, LEUR PREPARATION ET LEUR APPLICATION A TITRE DE MEDICAMENTS

(57) Abstract: The invention relates to compounds of general formula (I) which can be used for producing a medicament for inhibiting monoamine oxydases (MAO) and/or for lipidic peroxydation and/or for acting as modulators of sodium channels. The resulting medicament is particularly for use for treating Parkinson's disease, senile dementia, Alzheimer's disease, Huntington's chorea, amyotrophic lateral sclerosis, schizophrenia, depression, psychosis, pain and epilepsy. The inventive compounds correspond to general formula (I), wherein Het is a 5-membered heterocycle comprising 2 heteroatoms and is such that general formula (I) corresponds exclusively to one of sub-formulae: (I)<sub>1</sub>, (I)<sub>2</sub>, (I)<sub>3</sub> and (I)<sub>4</sub>.

wherein A represents especially a substituted phenyl or biphenyl radical, B represents especially H or an alkyl radical, X represents especially NH or S, Y represents O or S, n is a whole number from 0 to 6, R<sup>1</sup> and R<sup>2</sup> represent, independently of each other, especially radicals chosen from the following: a hydrogen atom or an alkyl or cycloalkyl radical; and Omega represents NR<sup>46</sup>R<sup>47</sup> or OR<sup>48</sup>, R<sup>46</sup> and R<sup>47</sup> representing especially radicals chosen from the following: an atom of hydrogen and an alkyl, cycloalkyl, alkynyl, cyanoalkyl, alkoxyalkyl, aralkoxyalkyl or (cycloalkyl)oxyalkyl radical and R<sup>48</sup> representing a hydrogen atom or an alkyl, alkynyl or cyanoalkyl radical.

(57) Abrégé: Les composés répondant à la formule générale (I) peuvent être utilisés pour préparer un médicament destiné à inhiber les monoamine oxydases (MAO) et/ou peroxydation lipidique et/ou à agir en tant que modulateurs des canaux sodiques. En particulier le médicament préparé sera destiné à traiter la maladie de Parkinson, les démences séniles, la maladie d'Alzheimer, la chorée de Huntington, la sclérose latérale amyotrophique, la schizophrénie, les dépressions, les psychoses, la douleur et l'épilepsie. Les composés de l'invention répondent à la formule générale (I) dans laquelle Het est un hétérocycle à 5 chaînons comportant 2 hétéroatomes et tel que la formule générale
